A Test Station for the Testing of Methods for Determining the Pollution of the Air

Orig Pub: Ceskosl. hyg., epidemiol., mikrobioll., imunol., 1955, Vol 4, No 5, 245-248 (in Czech with summaries in English and Russian)

Abstract: The organization and work of a test station (TS) for the testing of methods for the determination of small concentrations of gases in the atmosphere are described. The TS is a modification of the station proposed by Uron and Boggs (Anal. Chem., 1951, Vol23, 1517). The gas to be tested is introduced continuously into a stream of air or nitrogen. The functioning of the TS has been checked

Catalytic Cracking in the Petroleum Refinery at Sisak (Katalitičko krekovanje u Rafineriji nafte u Sisku)

PERIODICAL:

Tehnika, 1959, Nr 3, pp 461-469 (YUG)

ABSTRACT:

The article deals with the "Orthoflow A" fluid cat cracker, part of the Combination Unit at the Petroleum Refinery at Sisak. The cat cracker was designed by "F. Uhde GmbH" in Dortmund with the assistance of, and under license from, the "M.W. Kellogg Co", New York, and can crack 285 tons of crude a day. An outline of the operation of the unit is given and the author analyzes in some detail the corrosion caused by the circulating catalyst. Suggestions are made on how to reduce and avoid this damage. The quality of the

Fiser/ TITLE: Treatment of basilar impression SOURCE: Ceskoslovenska neurologie, v. 28, no. 6, 1965, 419-425 TOPIC TAGS: central nervous system, skeletal mechanics, bone, biologic reproduction, neurologic surgery, plastic surgery, orthopedic surgery ABSTRACT: Basilar impression is a congential malformation of the cranio-vertebral junction; symptoms occur in adult life. Late appearance of neurological complications results from reduction of space and deterioration of affected structures of CNS.
When signs of CNS involvement appear, surgical treatment is needed. Plastic operation of cranio-cervical junction without incision of the dural sac or revision of the posterior fossa, but with freeing of arachnoid adhesions or with resection of the cerebellar tonsils improved the patients' condition in 15 operations. In the anterior form of basilar impression no improvement was achieved. Orig. art. has: 1 figure and 1 table. Abstract

: Twenty children aged 4 months to 2 years and ill with rickets were placed under observation. The triple introduction into the miscle of 15 mg of calciferol (I) in all the children gave a positive results; however, the rate with which X-ray and clinical symtoms disappeared in different children varied significantly. A different therapeutic effect did not depend on the gravity of the clinical and biological symptoms. The content of Ca in the serum before the beginning of the treatment was < 9 mg/s in more than half of the children; after the first

Card 1/2

YUGCSLAVIA/Human and Animal Physiology - Metabolism.

T-2

Abs Jour : Ref Zhur - Biol., No 7, 1958, 31404

injection of I, the content of Ca in the serum gradually increases, and then in the course of 2-3 weeks gradually falls. The content of inorganic phosphorus was low in almost all of the children (1.7-4 mg/s) and during the introduction of I slowly returned to normal. An expressed correlation between the rate of complete recovery and the normalization of the phosphorus content in the blood was observed in only part of the children. The activity of the alkaline phosphatases in the sick children in comparison with healthy ones was higher; under the influence of the treatment, the characteristic course of the curve of the activity of the enzyme was established - a rise, with a subsequent slow fall to a norm, over 2 month. Aminoaciduria which was observed in children ill with rickets decreased with the introduction of I.
